

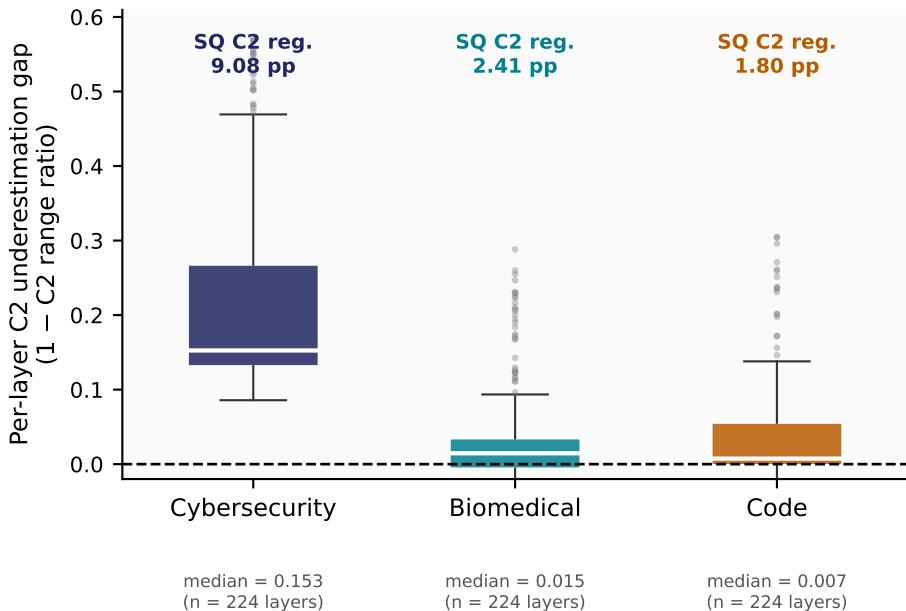

**Fig. 6: Per-layer C2 underestimation gap by domain
(n = 224 SmoothQuant-targeted layers per box)**

Per-layer distributions are cleanly separated between domains; the cyber median (≈ 0.21) is $> 5\times$ the medical/code medians, mirroring the rank order of the SQ C2 MMLU regressions shown above each box. The per-layer evidence demonstrates the gap is a consistent property of the calibration mismatch, not driven by outlier layers.
